

1

a)

A house-shaped grid for division. The roof contains the number $= 2$. The main body of the house is divided into 7 horizontal rows by solid lines. A vertical dashed line runs down the center of each row, and a horizontal dashed line is positioned just below the top solid line of each row, creating a space for the quotient. A small chimney is on the right side of the roof.

b)

A house-shaped grid for division. The roof contains the number $= 3$. The main body of the house is divided into 7 horizontal rows by solid lines. A vertical dashed line runs down the center of each row, and a horizontal dashed line is positioned just below the top solid line of each row, creating a space for the quotient. A small chimney is on the right side of the roof.

2

a)

A house-shaped grid for division. The roof contains the number $= 4$. The main body of the house is divided into 7 horizontal rows by solid lines. A vertical dashed line runs down the center of each row, and a horizontal dashed line is positioned just below the top solid line of each row, creating a space for the quotient. A small chimney is on the right side of the roof.

b)

A house-shaped grid for division. The roof contains the number $= 5$. The main body of the house is divided into 7 horizontal rows by solid lines. A vertical dashed line runs down the center of each row, and a horizontal dashed line is positioned just below the top solid line of each row, creating a space for the quotient. A small chimney is on the right side of the roof.
